Apocalypse: Earthquakes, Archaeology, And The Wrath Of God

Synopsis

What if Troy was not destroyed in the epic battle immortalized by Homer? What if many legendary cities of the ancient world did not meet their ends through war and conquest as archaeologists and historians believe, but in fact were laid waste by a force of nature so catastrophic that religions and legends describe it as the wrath of god? *Apocalypse* brings the latest scientific evidence to bear on biblical accounts, mythology, and the archaeological record to explore how ancient and modern earthquakes have shaped history--and, for some civilizations, seemingly heralded the end of the world. Archaeologists are trained to seek human causes behind the ruins they study. Because of this, the subtle clues that indicate earthquake damage are often overlooked or even ignored. Amos Nur bridges the gap that for too long has separated archaeology and seismology. He examines tantalizing evidence of earthquakes at some of the world's most famous archaeological sites in the Mediterranean and elsewhere, including Troy, Jericho, Knossos, Mycenae, Armageddon, Teotihuac n, and Petra. He reveals what the Bible, the Iliad, and other writings can tell us about the seismic calamities that may have rocked the ancient world. He even explores how earthquakes may have helped preserve the Dead Sea Scrolls. As Nur shows, recognizing earthquake damage in the shifted foundations and toppled arches of historic ruins is vital today because the scientific record of world earthquake risks is still incomplete. *Apocalypse* explains where and why ancient earthquakes struck--and could strike again.

One of the subjects that fascinated me in school, and indeed, for most of my life, has been the topic of archaeology. Forget Indiana Jones, the real excitement is untangling the clues left by the past, and what with the new technology that keeps appearing all of the time, the reinterpretation of what we thought were the facts. Author Amos Nur with Dawn Burgess looks at how geology has affected history -- and it's the immense changes that an earthquake can unleash on civilization. Nur, a professor at Stanford University in California, takes a closer look at the end of the Bronze Age, about 300-500 BCE, and comes up with some surprising new theories for why so many civilizations failed in such a short span of time. The traditional theory is that the eastern Mediterranean was overrun by what was known as the Sea Peoples, who looted and burned cities in their wake, leaving not much else behind but scorched ruins. What skeletal remains have been found have been explained away by war injuries, and left at that. If the idea of earthquakes causing destruction came up, many archaeologists dismissed the notion out of hand, saying that it was very unlikely and not very possible. Amos Nur takes a very different track, however. By using geology, archaeology, and even biblical legend, he gives a provocative new theory that much of the Bronze Age civilizations came to an end by a series of earthquakes, and triggered tsunamis.
